in as little as 15 minutes!*

- **1 TREATMENT**
- **2-8 SHADES BRIGHTER**
- **FDA APPROVED**

Offered Exclusively at:

TANQUEST
SUN SPAS

BleachBright has revolutionized the science of teeth whitening. The true essence of a smile is just light speeds away. Our business is state-of-the-art technology that is safe, revolutionary, and economical.

We use our BleachBright plus blue light emission LED light which is calibrated at the precise wavelength to activate our BleachBright whitening products. These products accelerate the whitening process in just 15 to 20 minutes.

Our special LED mouthpiece/lens has been designed for comfort and precision for the perfect smile.

This process has been proven safe for the tooth enamel, gums, and other soft tissues. The light intensifies and releases the hydroxyl radicals that accelerate the tooth structure stains which dissipate with no side effects. Our advanced spectrum controlled light is positioned to apply its energy just outside of the clear mouthpiece lens. In order to do this, the light is positioned between the upper and lower teeth.

The wavelengths of the BleachBright plus light are well within the safe visible blue light spectrum. Using BleachBright products will achieve extraordinary teeth whitening results.

Despite our best efforts, it's quite normal for our teeth to get darker. Many of the things we consume create stains; particularly things like dark or acidic liquids like soda or coffee, smoking cigarettes, chewing tobacco, and even some medications. Our genetics even play a role in the color of our teeth.

Generally speaking, our teeth get darker every day.

In spite of the natural darkening process, most of us want a whiter smile. Whiter smiles enhance our appearance and may even lead to greater self-esteem and confidence. For some, it's a statement about personal health and hygiene. For others, it's a way to look and feel younger or a great way to make a positive first impression.

We all have our own reasons, but most of us can agree that a new smile creates a new you.

HOW IT WORKS

PRESSURE:

BleachBright products are placed perfectly into pressure pockets in the mouthpiece/lens, which creates a squeezing effect and forces the specifically thick carbamide peroxide gel into each tooth structure.

HEAT:

Combination of the BleachBright products, pressure, and the BleachBright plus light beaming through the innovative mouthpiece all work together to react with the internal mouth temperature to create an increase of the peroxide temperature which intensifies the hydroxyl radicals which whitens your teeth quicker, better, and whiter.

It is also confirmed that temperature and light represent the main catalysts. BleachBright's LED light warms and activates the carbamide peroxide enough for it to reduce the duration of treatment.

EXPOSURE:

Studies have shown the longer you expose your teeth to the combination of light, pressure, heat, and carbamide peroxide, the whiter the teeth will become. Of course, this is only to the range achievable by one's teeth.
